

The Research at a Glance

What the Paper Does

- Applies **Altman's Z"-score model** to 90 Greek public hospitals (2022)
- Tests relationship between **governance attributes** and financial distress
- Examines: Location, Size, Specialty, CEO Gender

Central Finding

All hospitals have Z-scores > 5.5 (mean: 15.7) → "Financially Viable"

BUT: Paper argues this is misleading due to:

- €1.9B annual government subsidies
- 1,485-day receivables collection period
- Rising overdue liabilities (€344M → €1,164M in 5 years)

Key Claim

"Financial distress requires redefinition in the context of public entities, since their closure is not a core strategy"
